

CloudShelf

Android client for Amazon S3 — your phone, your AWS account, your storage.

Stop renting cloud storage. Use the AWS account you already have.

CloudShelf turns your S3 bucket into a phone-friendly file vault — browse, upload, download, preview, and share — with the price tag of cloud infrastructure instead of consumer cloud storage.

The Math

Same data, different bill. Yearly cost at common capacities (US-East, May 2026):

Capacity	Google Drive	iCloud+	Dropbox	S3 Standard (hot files)	S3 Glacier IR (browseable archive)	S3 Deep Archive (cold backup)
200 GB	\$36	\$36	—	\$55	\$10	\$2.40
2 TB	\$120	\$120	\$144	\$565	\$98	\$24.30
6 TB	—	\$360	—	\$1,696	\$295	\$73

Translation: for things you rarely touch (old photos, project archives, video originals), CloudShelf + Glacier Deep Archive costs **80–95% less** than Google Drive or iCloud at the same capacity. Active files cost roughly the same — but you keep CloudShelf's other advantages.

The unlock isn't "S3 is always cheaper." It's that **you choose the tier per bucket or per file** — pay hot prices for daily files, cold prices for archives, blend the two with a lifecycle rule. Consumer clouds don't let you do that.

Why CloudShelf, not the AWS CLI or Console

- **Touch-friendly browser** — buckets, folders, breadcrumbs, multi-select.
- **In-app preview** — images, PDFs, videos, text.
- **Background uploads** — survive screen lock and app kill.
- **Auto camera-roll backup** (*coming*) — Wi-Fi-only, charging-only.
- **Cost lens** (*coming*) — exact monthly cost per bucket.
- **Multi-cloud ready** — Wasabi, Backblaze B2, Cloudflare R2.

Privacy is built in, not bolted on

- **Your data, your account.** Files go straight to S3 — never proxied.
- **No vendor scanning.** AWS treats your objects as opaque bytes.
- **No SaaS account.** The only login is your AWS account.
- **Encrypted at rest** with SSE-S3 (AES-256) or SSE-KMS with your own key.
- **Revokable instantly** — rotate the IAM key, app loses access.

See it in action

Real screenshots from CloudShelf running on Android — connecting an AWS account and browsing live buckets.

1. Pick your sign-in

Account (Cognito) tab — gracefully disabled until configured. IAM key tab is the default path.

2. Paste an IAM key

Keys encrypted on device by Android Keystore. Region defaults to us-east-1; auto-detected per bucket.

3. Your buckets, instantly

Lists every bucket the IAM key can see, with region indicator on each. Refresh, switch account, settings.

4. Browse like a file manager

Breadcrumbs, search-in-folder, sort, create folder. Upload FAB launches background transfer via WorkManager.

Who it's for

- Developers, sysadmins, DevOps — you already have AWS; this makes it usable on mobile.
- Photographers and videographers — 4K and RAW archives in Glacier for coffee money.
- Privacy-conscious users — no ML run over your family photos.
- Small businesses on AWS — give the team a mobile client for buckets you already pay for.
- Anyone tired of the iCloud or Google One upsell.

How it works

1. Open CloudShelf, paste an AWS access key with S3 permissions (90 seconds).
2. CloudShelf lists your buckets, auto-detects each region.
3. Browse. Upload. Download. Share. Done.

No account creation. No SaaS subscription. The only thing on our servers is the APK — your files never touch us.

CloudShelf is an independent Android client for Amazon S3 — not affiliated with, endorsed by, or sponsored by AWS, Google, Apple, or Dropbox. Prices shown are AWS S3 list prices in us-east-1 as of May 2026; check AWS pricing for current numbers. Egress, restore, and request fees apply per AWS S3 standard rates. CloudShelf does not store, scan, or proxy your files. Screenshots show a real device running CloudShelf against a personal AWS account; bucket names and IAM key values have been redacted.
